Heavy Brace Gusset Design Example

Author:Kevin Cowie; Alistair FussellAffiliation:Steel Construction New Zealand Inc.Date: 27^{th} July 2011Ref.:CON1303

Key Words

Heavy Brace Connection, Gusset, Design Example, Eccentrically Braced Frame, Modified Uniform Force Method.

Introduction

This worked example illustrates the ductile design of brace/beam/column gusset plate connection. The example is based on the design approach presented in Steel Advisor CON1301.

The configuration and details of the gusset plate connection are shown in figure 1.

The brace load N^{*} has been calculated separately using a capacity design approach.

 $N^* = 2000 \text{ kN}$

Figure 1: EBF Connection Detail

A) Design of Gusset

1. Tearout of the gusset plate

Disclaimer: SCNZ and the author(s) of this document make no warrantee, guarantee or representation in connection with this document and shall not be held liable or responsible for any loss or damage resulting from the use of this document

Steel Advisor CON1303 © Steel Construction New Zealand Inc. 2011 $N_t^* = 2000$

Block Shear Gusset Plate

$$\begin{array}{ll} t_{g} &= \text{gusset plate thickness} = 20\text{mm} \\ A_{nt} &= 300 \times 20 = 6000\text{mm}^{2} \\ A_{nv} &= 600 \times 2 \times 20 = 24000\text{mm}^{2} \\ \phi N_{BS} &= \begin{bmatrix} \phi \left(0.6f_{y} A_{gv} + f_{u} A_{nt} \right) \\ \phi \left(0.6f_{u} A_{nv} + f_{y} A_{gt} \right) \end{bmatrix}_{\text{min}} \\ &= 0.9 \times \min_{\text{min}} \begin{bmatrix} 0.6 \times 250 \times 24000 + 410 \times 6000 \\ 0.6 \times 410 \times 24000 + 250 \times 6000 \end{bmatrix} \\ &= 0.9 \times \min_{\text{min}} [6060, 7404] \\ &= 5454 \end{array}$$

Note: $A_{gt} = A_{nt}$ and $A_{nv} = A_{gt}$ for welded connections.

2. Tension Yielding on Whitmore Section of Gusset

 ℓ_w = Whitmore section length = 300 + 2 x 600 x tan 30° = 993mm

The Whitmore section length extends 246mm into the beam web and 86mm into the column web. The web thickness is used, conservatively ignoring the larger flange area.

Web thickness of column = 25mm

Web thickness of beam = 9.6mm

$$\phi R_s = \phi A_w f$$

 $= 0.9 (661 \times 20 \times 250 + 86 \times 25 \times 300 + 246 \times 9.6 \times 320)$ = 4235 kN > N_t* \therefore OK

3. Buckling of the Gusset Plate

The buckling capacity is calculated by the strip of plate defined by the Whitmore section as a column.

The design, L, is taken as average length of ℓ_1 , ℓ_2 and ℓ_3 . Note for this particular example ℓ_1 and ℓ_3 are negative.

L = $\frac{\ell_1, \ell_2, \ell_3}{3}$ = $\frac{320+(0)+(0)}{3}$ (ignoring negative values) = 107 mm

The effective length factor, k_{er} is 0.7 and is taken from NZS 3404: 1997 cl 12.9.7.2 (b).

The radius of gyration is $r = \frac{t_g}{\sqrt{12}} = \frac{20}{\sqrt{12}} = 5.77$

The form factor, k_{fr} is taken as 1.0 and the member section constant, $\alpha_b = 0.5$

$$\begin{split} \mathsf{N}_{\mathsf{s}} &= \mathsf{R}_{\mathsf{s}} \text{ as determined above.} \\ \Rightarrow & \phi \mathsf{N}_{\mathsf{c}} &= \phi \alpha_{\mathsf{c}} \mathsf{R}_{\mathsf{s}} \\ \lambda_{\mathsf{n}} &= \left(\frac{L_{e}}{r}\right) \sqrt{k_{f}} \sqrt{\frac{f_{y}}{250}} \\ &= \frac{107}{5.77} \sqrt{1.0} \sqrt{\frac{250}{250}} = 18.5 \\ \text{From table 6.3.3(2) NZS 3404 } \alpha_{\mathsf{c}} = 0.97 \\ \Rightarrow & \phi \mathsf{N}_{\mathsf{c}} &= 0.97 \times 4235 = 4108 \text{kN} > \mathsf{N}_{\mathsf{c}}^{*} \therefore \mathsf{OK} \end{split}$$

Check Gusset Edge Stability 4.

 $\leq \frac{c_1 t_p}{\sqrt{f_y/250}}$ bg = 45 for gusset welded to supporting member(s) C_1 $\frac{45 \times 20}{\sqrt{250/250}}$ ba ≤ 900mm OK! OK

(Eqn 10.16 from (Clifton, 1994))

Maximum unsupported edge length $b_g = 540 < 900$

5. Determine Gusset Interface Actions

Use modified Uniform Force Method (see paper (Muir, 2008))

From the members and frame geometry d_{h}

$$e_{b} = \frac{a_{b}}{2} = 264mm$$

$$e_{c} = \frac{d_{c}}{2} + t_{ep}$$

$$= \frac{339}{2} + 25 = 194.5mm$$

Brace angle from vertical $\theta = 45^{\circ}$

- ℓ_{gb} = length of gusset along beam = 840mm
- = thickness of end plate t_{ep}

$$= 25 \text{mm}$$

 ℓ_{ab}

$$\alpha = \frac{cg_D}{2} + t_{ep}$$

= length of gusset along column lae = 740mm

$$\beta = \frac{\ell_{gc}}{2}$$

Figure 2: Gusset free body diagram

On the gusset-to-column connection

$$H_{c}^{*} = \frac{\cos(\theta)e_{c}}{(e_{b}+\beta)} \times P^{*}$$

= 433kN
$$V_{c}^{*} = P^{*}\cos\theta - V_{b}^{*}$$

= 832.6kN

On the gusset-to-beam connections

$$V_{b}^{*} = \left[\frac{e_{b}[\sin(\phi)(e_{b}+\beta)-\cos(\theta)e_{c}]}{\alpha(e_{b}+\beta)}\right]P^{*}$$

= 581.6kN
$$H_{b}^{*} = P^{*}\sin(\theta) - H_{c}^{*}$$

= 981kN

6. Combine Action Plate Check

The vertical location occurs at the gusset interfaces.

B-B is critical since largest combined actions.

Using modified Uniform Force Method $H_{b}^{*} = 981kN$ $V_{b}^{*} = 582kN$

 $\begin{array}{l} \mbox{Gusset Local Shear Capacity} \\ \phi V_g \ = \ \phi 0.6 \ A_g f_{yg} \\ \ = \ 0.9 \ x \ 0.6 \ x \ 840 \ x \ 20 \ x \ 250/1000 \\ \ = \ 2268 kN \ > \ H_b^{\ *} \ \ OK \end{array}$

$$= 3780$$
kN $> V_b^*$ OK

Check Combined Stresses at b-b interface

$$\left(\frac{H_b^*}{\phi V_g}\right)^2 + \left(\frac{V_b^*}{\phi N_g}\right)^2 \le 1.0$$

$$\left(\frac{981}{2268}\right)^2 + \left(\frac{582}{3780}\right)^2 = 0.21 \le 1.0 \quad \text{OK}$$

(Eqn 10.2 from (Clifton, 1994))

7. Gusset Weld to Beam

Distribution of gusset interface stress not uniform, weld designed to develop the design tension capacity at the connection.

For 20mm plate tensile design capacity. $h_{\text{N}} = h_{\text{T}} h_{\text{T}}$

$$\phi N_t = \phi f_y A_s$$

= 0.9x $\frac{250}{1000}$ x20 / mm
= 4.5kN/mm

Steel Advisor CON1303 © Steel Construction New Zealand Inc. 2011 For 2 parallel welds either side of plate. $V_w^* = 4.5/2 = 2.25$ kN/mm $\phi V_w = 1.96$ kN/mm for 12mm fillet E48 electrode.

Since $\phi V_w = 1.96 < 2.25$ use full strength butt as generally more cost effective than increasing fillet weld above 12mm.

8. Gusset Weld to End Plate

Distribution of forces not uniform, weld designed to develop the design tension capacity at the connection. Calculations as per (7) above, use full strength butt weld.

B) End Plate

1. Gusset to Endplate Local Capacity

Using modified Uniform Force Method $H_c^* = 433kN$ $V_c^* = 832kN$

Need to consider gusset length that is effective in transferring through endplate into bolts.

$$0.9S_g = 0.9 \times 140 = 126mm$$

 $S_p = 90mm$

 ℓ_{qe} = 2 x 126 +90 x 4 = 612mm

Gusset local shear capacity

$$\begin{split} \varphi \mathsf{V}_{\mathsf{g}} &= \varphi 0.6 \; \mathsf{f}_{\mathsf{yg}} \; \ell_{\mathsf{ge}} \mathsf{t}_{\mathsf{g}} \\ &= 0.9 \; \mathsf{x} \; 0.6 \; \mathsf{x} \; 612 \; \mathsf{x} \; 20 \; \mathsf{x} \; 250/1000 \\ &= 1652 \mathsf{kN} \; > \mathsf{V_c}^* \qquad \mathsf{OK} \end{split}$$

Gusset local tension capacity

$$\begin{split} \phi \mathsf{N}_{\mathsf{g}} &= \phi \; \ell_{\mathsf{ge}} \mathsf{t}_{\mathsf{g}} \; \mathsf{f}_{\mathsf{yg}} \\ &= 0.9 \; \mathsf{x} \; 612 \; \mathsf{x} \; 20 \; \mathsf{x} \; 250/1000 \\ &= 2754 \mathsf{kN} > \mathsf{H}_{\mathsf{c}}^{*} \quad \mathsf{OK} \end{split}$$

Check Combined

$$\begin{pmatrix} \frac{H_c^*}{\phi N_g} \end{pmatrix}^2 + \left(\frac{V_c^*}{\phi V_g} \right)^2 \le 1.0$$

$$\begin{pmatrix} \frac{433}{2754} \end{pmatrix}^2 + \left(\frac{832}{1652} \right)^2 = 0.28 \le 1.0$$
 ok

2. Check Tension Capacity of Endplate

The yield line solutions from SCI publication p207/95 "Joints in Steel Construction – Moment Connections" have been used to determine the tensile capacity of the gusset end plate.

Tension Yield Line Pattern:

Steel Advisor CON1303 © Steel Construction New Zealand Inc. 2011 Equivalent effective T-stub length for group. (pp35 SCI 207/95)

 $m = \frac{(140-20)}{2} = 60mm$ $\ell_e = 4m + 1.25e + 4p$ $= 3 \times 60 + 1.25 \times 55 + 4 \times 90$ = 609mm

Mode 1: 4 Plastic Hinges in T-Stub (pp44 HERA Report R4-142) $\phi N_{i} = -\frac{\phi_{s} f_{yi} \ell_{e} t_{i}^{2}}{2}$

 ϕN_1

$$= \frac{m}{\frac{0.9 \times 250 \, MPa \times 609 \times 25^2}{60}}$$

= 1.427 kN

Mode 2: 2 Plastic Hinges in T-Stub (pp45 HERA Report R4-142)

n = min
$$\left[\frac{b_p}{2} - \frac{3g}{2}; 1.25m_1\right]$$

= min $\left[\frac{250-140}{2}; 1.25 \times 60\right]$
= min $\left[55, 75\right] = 55mm$
 ϕN_2 = $\frac{0.5 \varphi_s f_{yl} \ell_e t_l^2 + n \, 10 \, \varphi_b N_{tf}}{m+n}$
= $\frac{0.5 \times 0.9 \times 250 \times 609 \times 25^2 + 55 \times 10 \times 373}{60+55}$ (10³)
= 2156 kN

 \Rightarrow Mode 1 Governs > H_c^*

 \therefore OK! (This will ensure ductile behaviour as brittle mode 3 suppressed by strength hierarchy)

3. Brace Gusset/Column Bolted Connection

 $\begin{array}{ll} \mbox{Try 6 M30 bolts.} \\ \mbox{V}_c &= 833 kN \\ \mbox{H}_c &= 433 kN \end{array} \mbox{ (determined using modified uniform force method)} \end{array}$

Endplate thickness = 25mm

Check complies with maximum plate thickness. $T_{p,max} \le 0.9 d_f = 0.9 x 30 = 27 mm > 25$ OK Allow 40% extra for prying action

$$T^{*} = \frac{433 \times 1.4}{6} = 101 \text{kN}$$

$$V^{*} = \frac{833}{6} = 139 \text{kN}$$

$$\phi V_{f} = 214 \text{kN} \text{ M30 threads included}$$

$$\phi N_{f} = 373 \text{kN}$$

Combined check $\left(\frac{V^*}{\phi V_f}\right)^2 + \left(\frac{N^*}{\phi N_{tf}}\right)^2 = \left(\frac{101}{372}\right)^2 + \left(\frac{139}{214}\right)^2 = 0.50 < 1.0$ OK

C. COLUMN FLANGE TENSION CHECK

The column flange is wider and thicker than the end plate (ie $H_{tc} = 32 > 25$ mm). The column web is thicker than the gusset plate. And so, by inspection, the column flange will be stronger than the end plate. Therefore, the appropriate strength hierarchy has been achieved.

D. COLUMN WEB CRIPPLING CHECK

Check if column can sustain compression loading from bottom flange if collector beam section capacity ϕM_s is developed due to frame action induced moment.

- $N^* = \phi f_y A_f = 0.9 \times 320 \times 2758 = 794 kN$
- f_y = 320 MP_a
- A_{f} = 209 x 13.2 = 2758mm²

Spread of load – 1:2.5 through flanges, 1:1 through web.

Bearing width

 $b_{b} = 13.2 + 2.5 \times 2 (32+25) + 2 \times \left(\frac{339}{2} - 32\right)$ = 575mm $b_{bf} = 13.2 + 2.5 \times 2 (32+25) = 298.2mm$

1. Bearing Yielding Capacity

 $\phi R_{by} = \phi \ 1.25 \ b_{bf} t_w f_y$ = 0.9 x 1.25 x 298 x 25 x 300 = 2514kN > 794 OK

2. Bearing Buckling Capacity

 $\begin{array}{l} \varphi \mathsf{R}_{bb} = \ \varphi \alpha_c \mathsf{A}_{bb} \mathsf{f}_y \\ \mathsf{A}_{bb} = \ \mathsf{b}_{bb} \ \mathsf{A}_w = 575 \ x \ 25 \\ = \ 14375 \text{mm}^2 \\ \hline \\ \frac{Le}{r} = \ 2.5 \frac{d_1}{t_w} \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 275 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 325 \text{mm} \\ \hline \\ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 325 \text{mm} \\ \hline \ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 2 = \ 325 \text{mm} \\ \hline \ \mathbf{d}_1 = \ 339 - \ 32 \ x \ 3 = \ 325 \text{mm} \\ \hline \ \mathbf{d}_1 = \ 339 \ x \ 3 = \ 325 \text{mm} \\ \ \mathbf{d}_1 = \ \mathbf{d}_2 = \ \mathbf{d}_1 = \ \mathbf{d}_2 = \ \mathbf{d}_1 = \ \mathbf{d}_1 = \ \mathbf{d}_2 = \ \mathbf{d}_2 = \ \mathbf{d}_1 = \ \mathbf{d}_2 = \ \mathbf{d}_1 = \ \mathbf{d}_2 = \ \mathbf{d}_2 = \ \mathbf{d}_2 = \ \mathbf{d}_1 = \ \mathbf{d}_1 = \ \mathbf{d}_2 = \ \mathbf{$

No compression stiffener required.

Note: Beam to connection calculations has not been under taken. The design checks for this connection are similar to these in section B.

A check is also required of the collector beam web for shear and tension.
